In Alabama, the hot, humid summers are a perfect fit for growing tomatoes. First, choose which variety you'd like to grow. Second, choose a spot with a lot of sunlight for the tomato plant. Third, dig a hole about two feet deep and put the tomato plant in the hole along with fresh soil, fertilizer and water, and pack the soil tightly to keep air bubbles away from the roots. Now that it’s planted, water it daily and wait to taste a sweet, juicy tomato.

Did you know?
Since a tomato is the part of the plant that protects the seeds, it is considered a fruit, not a vegetable!
